

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently amended) A liquid crystal display comprising:

a TFT array panel including a plurality of first display signal lines, a plurality of second display signal lines crossing the first display signal lines, a plurality of switching elements electrically connected to the first display signal lines and the second display signal lines, and a plurality of pixel electrodes electrically connected to the switching elements;

a driver disposed on the TFT array panel proximate to one edge of the TFT array panel;

an inspection line formed on the TFT array panel and passing under a place where the driver is formed for transmitting a test signal to the second display signal lines, [[and]]

a test pad formed on the TFT array panel and connected to the inspection line, for receiving the test signal, and

a plurality of flexible films attached to the TFT array panel,

wherein the inspection line is electrically separated from the first and second display signal lines, the switching elements, and the pixel electrodes,

the test pad is disposed between the driver and the one edge of the TFT array panel, and the test pad is located under the place where the flexible film is formed.

2. (Previously presented) The liquid crystal display of claim 1, wherein the inspection line comprises at least two inspection lines, and the second display signal lines are alternately connected to the at least two inspection lines.

3. (Previously presented) The liquid crystal display of claim 1, wherein the driver includes a plurality of drivers connected to the second display signal lines.

4. (Original) The liquid crystal display of claim 3, further comprising a plurality of connecting lines interconnecting the drivers.

5. (Original) The liquid crystal display of claim 4, wherein the connecting lines extend straight.

6. (Previously presented) The liquid crystal display of claim 4, wherein the test pad is closer to the one edge of the TFT array panel than to the connecting lines.

7. (Canceled)

8. (Original) The liquid crystal display of claim 3, wherein each of the drivers is formed as a chip.

9. (Canceled)

10. (Canceled)

11. (Previously presented) The liquid crystal display of claim 1, further comprising a connecting member including the same layer as the pixel electrodes, wherein the connecting member is connected to at least one of the inspection line and the second display signal lines.

12. (Previously presented) The liquid crystal display of claim 11, wherein the inspection line includes the same material as at least one of the first display signal lines, the second display signal lines, and the pixel electrodes.

13. (Withdrawn) A testing method of an LCD including a plurality of first display signal lines, a plurality of second display signal lines crossing the first display signal lines, a plurality of switching elements connected to the first display signal lines and the second display signal lines, a plurality of pixel electrodes connected to the switching elements, and at least one inspection line for transmission of a test signal to the second display signal lines, the inspection lines being separated from the first and second display signal lines, the switching elements, and the pixel electrodes, the method comprising:

driving the pixel electrodes through the switching elements by applying a first test signal to the first display signal lines and a second test signal to the second display signal lines; and

disconnecting the connection between the second display signal lines and the at least one inspection line.

14. (Canceled)

15. (Currently amended) A liquid crystal display comprising:

a TFT array panel including a plurality of first display signal lines, a plurality of second display signal lines crossing the first display signal lines, a plurality of switching elements electrically connected to the first display signal lines and the second display signal lines, and a plurality of pixel electrodes electrically connected to the switching elements;

a driver disposed on the TFT array panel proximate to one edge of the TFT array panel;

flexible films attached to the TFT array panel;

driving signal lines formed on the flexible films;

an inspection line formed on the TFT array panel for transmitting a test signal to the second display signal lines; and

a test pad formed on the TFT array panel and connected to the inspection line, for receiving the test signal,

wherein the inspection line is electrically separated from the first and second display signal lines, the switching elements, and the pixel electrodes, [[and]] the test pad is disposed between the driving signal lines, and the test pad is located under the place where the flexible film is formed.
